Motivational Texts/Phrases

Overview:

“Can you code a lil widget/app for a phone some how that has motivation short texts that show up. Kinda like Co-star, but not focused on zodiac stuff. Just, like, motivational stuff. Like, the little widget for Co-Star today says "No self-denial, today" and that's been keepin me perky fr” -Lin.

Working it out

Array

- Have all the phrases in an array and print random phrases from it. That’s easy, and that’s what I did for the Ethi desktop pet

The code for this would just be, with the motivation phrases instead of Ethi’s phrases:

```
import java.util.Random;
import java.util.ArrayList;

public static void main(String[] args) {
                ArrayList<String> phrases = new ArrayList<String>();
                Random rand = new Random();

                phrases.add("I love you, Sy!");
                phrases.add("Hello, my beloved!");
        phrases.add("My amplifier is my heart, and you have my heart.");
                phrases.add("Thank you for existing.");
                int index = rand.nextInt(phrases.size());

                String value = phrases.get(index);

                System.out.println(value);
        }
```

Java: Actual, working base code

```java
import java.util.Random;
import java.util.ArrayList;

public class Main {
  public static void main(String[] args) {
            ArrayList<String> phrases = new ArrayList<String>();
            Random rand = new Random();

            phrases.add("No self-doubt today.");
            phrases.add("Be proud of yourself today :)");
           phrases.add("Look at what all you've accomplished!");
            phrases.add("Be unconventional today~");
            phrases.add("So proud of you!!");
            phrases.add("You've done so well.");
            phrases.add("You've come so far.");
            phrases.add("'I'm not this darkskined just to end up thinking
like the white man.' -Cara");
            phrases.add("'If you have the ability to get upset, that also
means you have the ability to be happy.' -Ulysses");
            phrases.add("'Anywhere you can protect yourself is 'safe'.'
-Ezaiyah");
            phrases.add("'I'd rather face those against me as myself so
that I have more to face them with.' -Ulysses");
            phrases.add("'Think: 'If I could, what would I do in this
situation?'.' -Omar");

            int index = rand.nextInt(phrases.size());

            String value = phrases.get(index);

            System.out.println(value);
      }

}
```

Java: GUI code

```java
import javax.swing.JFrame;
public class MotivationalPhrasesGUI {
      public static void main(String[] args) {
```

```
            //frame creation
            JFrame frame = new JFrame("Motivation Phrases");

            //panel creation
            MotivationalPhrasesPanel panel = new MotivationalPhrasesPanel();
            //frame
            frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
            frame.getContentPane().add(panel);
            frame.pack();
            //frame.show(); - deprecated, Java has replaced this function with
somethign else
            frame.setVisible(true);
      }
}
```

GDScript: Possible code:

```
Var MotivationalPhrases: Array[String] = ["No self-doubt today.", "Be proud
of yourself today :)", "Look at what all you've accomplished!", "Be
unconventional today~", "So proud of you!!", "You've done so well.", "You've
come so far.", "'I'm not this darkskined just to end up thinking like the
white man.' -Cara", "'If you have the ability to get upset, that also means
you have the ability to be happy.' -Ulysses", "'Anywhere you can protect
yourself is 'safe'.' -Ezaiyah", "'I'd rather face those against me as myself
so that I have more to face them with.' -Ulysses", "'Think: 'If I could,
what would I do in this situation?'.' -Omar"]

# Needs to just generate a phrase on open, or there can be a gen phrase
button - but prolly not
func GenRandomPhrase():
      talk(MotivationalPhrases.pick_random())

func talk(text:String) -> void:
$Chatbox.show()
%Textbox.text = text
```

Questions:

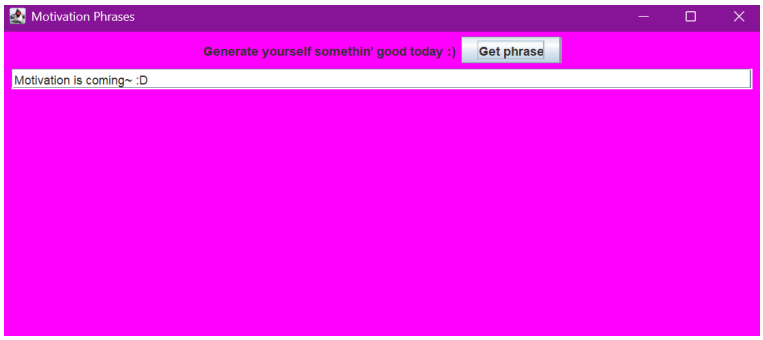

- How would this work for moving it over to an app? Well, I guess it would be the same as the Ethi Desktop Pet, right? I was gonna say, idk if an app can read words from an array like that, but the Ethi Desktop Pet technically is an app and Godot has the function to read random phrases from an array

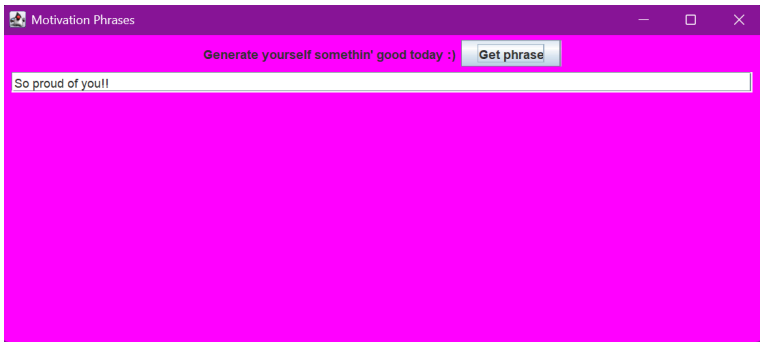

Things I need to learn more about for this side of the project

- App creation/apk creation
    - Swift (for android)
    - Or Android Studios

Options:

- Can make this into a GUI (note: wouldn't be able to run w/o Java open, I don't think? But, either way, how this would work: you run the program in Java, you generate a random phrase, you get your phrase for the day, you close the program.)
    - **DONE**

- Or use Godot to make an .exe program for it (note: ~~would have to code the intervals, where it shows up, if the box where its coded in stays on screen or disappears with the~~

~~intervals as well.~~ <- Actually not true, we only want one phrase per day. So, would just need it to be like: you click on the program, the phrase shows up, you read it and close out the program. Or, leave it on, as a sorta widget thing or just sumn that sits on your computer as you work/use it?? Haveta think abt that a lil more)

- **DONE FOR DESKTOP (need to make it resizable and draggable, however!) For android apk, need to fix something that's not running.**

Added the close button. Still not draggable just yet.

- Can make it into a web app that can send daily notifications to the computer (for now - as I work on learning more about mobile apps. Would need to learn how to create a web app, however. How this one would work: you have the tab running on your computer and it just sends a notification with a phrase to your computer notifications each day. You can click on your notifications window and read it whenever you want — the web app would have the phrase on the screen of the tab too, just in case the notification, like, gets deleted or something.)
- Could just jump into making it an app (would have to learn how to do so, would also have to learn how to make an app have a useable widget on android)

Desktop app:
https://www.youtube.com/watch?v=WRgrZcO3SVc
https://forum.godotengine.org/t/how-to-make-close-button/26909/2

Database

- **Basically, maybe a text file of motivational texts. Then the program will read out from it**
    - So, basically, I was right with this
- One thing tho, idk if I'd need to have a database or just, like, a long array. I feel like a long array can get kinda clunky, so, what would I need to create that holds all the sayings?
- Can put the phrases into .csv file
    - "When needed, you can always convert XLSX [excel spreadsheet] to CSV for simple edits or vice versa if you want more formatting options. Once you're done editing, convert to PDF with Acrobat for easy sharing and presenting." - https://www.adobe.com/acrobat/resources/document-files/what-is-a-csv-file.html

Database set-up

For the file, I'm guessing it would be set up like:

- 1, [phrase]
- 2, [phrase]
- etc.

(Maybe not…, cuz then the numbers would be read out I think too)

- I was fairly right here too

So that calling a phrase is easier? Like, call phrase one. Call phrase two. Etc.
BUT, also, the scanner also does this. I'd just have to use tokens. But then, that brings up the question of: how to to read random phrases?

- Fars I remember, the scanner starts scanning from a certain area and keeps going from there. Not in a random order.

DB Conflits

I'm not sure how to read random phrases, and read one phrase only.
So, I have the .csv file of phrases, this is my "database" of phrases.

What I want the program to do, 1. Go into the database. 2. Choose a random phrase from that database. 3. Print that phrase from the database alone.

DB Questions:

- How do you grab things from a database?
- How do you print one thing from a database?
- Is "parsing" an option? (I may have to learn more about parsing.)

    - **I think it is and it might be what I need to do**
- What about a searching method, is it an option?

Now that I think about it, if I'm thinking about this as a database, there needs to be rows and columns. And in my Motivational_phrases file, there's only rows - which is just the phrases….

So, either, I can *not* focus on it being a database. *Or,* I *can* turn it into a database.
- Which would lead to the question of, what would the database look like?

Columns would be: phrase number and phrase
Phrase value and phrase itself

I'm gonna make a google sheet to visualize it.
Motivational Phrases Database

So, if each phrase has a value, doesn't that make it easier to grab at random?

- Because, you have a value, and then you'd just need to tie that value to its phrase. Then once the value is chosen at random, you can somehow have it converted to its connected phrase when printed -A
- You're so smart, and there *should* be a way to do that, yes. I feel like I know how, just can't fully remember. Kinda like how all strings have a reference number, but it's converted to a String (through what method? I can't remember.) So, something like that… -TriBandD
- ASCII is like that too, right? -Aa
- Um… I think so! -TriBandD
- Like, the ASCII code for an apostrophe is whatever it is, but background html methods and other things convert it into just the apostrophe on the front-end side of things. -Aa
- Okay, so, I'm pretty sure you're *so* correct… I'd just need to figure out how to do this. But thank you *so* much. -TriBandD
- Of course!! -A & Aa

(I can probably create a flow chart to help me with visualize or connecting an int to a String.)

These motherfuckers were right as fuck: https://www.asciitable.com/
- An ascii table is basically a database itself… Cuz the rows and columns.

(One “problem” I’m thinking about right now, is if I wanna add more phrases to the database. I would manually have to re-upload the file to my code. But, that’ll be figured out when I get there.)

DB Questions now:

- How do you connect a value to a string, so that when that value is chosen, the string is printed instead of the value?

Answer: parseInt or parseString????

“There are certain methods for Integer to String conversions mentioned below:

Using the toString() method of the Integer class

Using the valueOf() method of the String class

Using Integer(int).toString() method of Integer class

Using concatenation with an empty string.”

https://www.geeksforgeeks.org/java/different-ways-for-integer-to-string-conversions-in-java/

String methods:
https://www.w3schools.com/java/java_ref_string.asp

Brainstorming:

Need to do a sorta:

int = String

kinda thing.

But that's saying that the int *is* the string and vice versa, I think. Which isn't correct.

Ul and I am wondering what: == means

- But I think that's for booleans only

Wait…is:

int = String

not setting that up as the int referencing the string? And if not, how do you reference something in code? -UI

I *feel* like it “is", but only in the way where it's close to what I actually want but *isn't* what I want, I don't think. But **“how do you reference something in code"** is a really good question!! -TriBandD

- Other possible q-s:
- How do you reference a string in code?
- How do you make an int reference a string in code?

What's coming to mind is setting up an “empty” reference, like an int (or even String?) placeholder as a kinda middle man to the int and String referencing. But idk

Actual Databases

Looking through resources, atp, I’m kinda like, should I just use a database?? There’s not a lotta resources you can find for just using a CSV and a lotta people say to:

- Not use a CSV
- Use MySQL
    - *Ugh, has AI*
- Use a different database manager
- Some things are also more python focused too - lotsa people recommend python for database stuff
- Also LibreBase

Which is just like, oof.

- One person recs using a CSV parser library for java
    - https://stackoverflow.com/questions/2410480/csv-reading-in-java?rq=4

I think this is a good resource for info on CSV reading and interaction for java

- https://stackoverflow.com/questions/6449734/importing-a-csv-file-in-java?rq=4

I’ve also seen that databases are also good to use when you have a lotta data, and Ion think this is gonna have a lotta data, so…

(God, I need a coding mentor lmfao.)

Things I need to learn more about for this side of the project

- Databases
- Python

Overall findings:

- Should I just use an array instead of a database? (that's easier, but just less complex and I wanna learn databases)
    - This answer to a question here even says to put the words *from the database* into an array: https://stackoverflow.com/questions/68764866/printing-an-array-of-random-words-given-the-number-of-words-requesed-by-input-in so it's like…wouldn't it just be easier to use an array?
    - I guess I can just start with the simple version, an array. Then, overtime, move it over to a database
